

Review scope and source identities

Prepared 2026-09-30; REVIEW, not a filing. All content is limited to the named source snapshots and selections. Table membership, codes, placeholders and estimated properties do not establish existence, discovery, stability, preparation, usable materials, applicant inventions, or physical/patent enablement. This PDF is a rendered view, not a byte-exact replacement for the retained source files. No data is truncated.

Entity vocabulary: scope and source notes

This historical register has 118 recognized element labels, 20 hypothetical placeholders and 17 particle categories under its stated counting convention; these are different counting objects from nuclear states and PDG charge-state rows.

ROW REGISTER:notes

JSON "# Entity register notes\n\nPrepared 29 September 2026. Companion: `entity\_register.json`. \n\n## Wh
 JSON at the artifact contains\n\n- Exactly 138 element records in atomic-number order: 118 recognized el
 JSON ements and 20 hypothetical placeholders.\n\n- Accepted names and symbols for Z = 1 through 118 follow
 JSON the [IUPAC table dated 4 May 2022](https://iupac.org/wp-content/uploads/2022/07/IUPAC_Periodic_Tab
 JSON le-04May22_CRA.pdf); the IUPAC source page was checked on 29 September 2026.\n\n- E119 through E138 a
 JSON re explicitly local placeholder labels, not accepted or systematic IUPAC symbols. Their accepted-na
 JSON me and accepted-symbol fields are null. The cited [IUPAC recognition and naming page](https://iupac
 JSON .org/what-we-do/periodic-table-of-elements/) supplies the recognized-table boundary, not evidence t
 JSON hat these extra elements exist.\n\n- A deliberately finite register of 17 Standard Model particle cat
 JSON egories, with the counting convention stated below.\n\n- Parameterization notes for composite particl

CONT REGISTER:notes

JSON es, quasiparticles, hypothetical particles and nuclide identities. No complete isotope table or the JSON oretical-particle universe is represented.\n\n## Element identity and status\n\n`atomic\_number` is JSON Z. `name` and `symbol` carry accepted IUPAC identities only when `status` is `recognized\_element`. JSON For a `hypothetical\_placeholder`, those two fields are local descriptive labels and `symbol\_kind` m JSON akes this explicit.\n\nEach element row carries a source URL, source-table edition date, and source JSON -check date. The 2022 edition date is not a discovery date. For hypothetical rows it identifies the JSON recognized table used as the comparison boundary. The choice of Z = 138 is an indexing boundary, n JSON ot a claimed physical limit.\n\nRecognition of an element does not establish that all its isotopes JSON exist, that macroscopic quantities are available, or that every composition is stable or synthesiza JSON ble. Isotopes, nuclear isomers, ions, allotropes and material phases must be distinguished without JSON counting them as additional elements. No atomic weights or property values are supplied.\n\n## Part JSON icle counting convention\n\nThe 17 entries mean six quark-flavor categories, three charged-lepton p JSON article/antiparticle categories, three neutrino-flavor categories, and five boson categories: photo JSON n, gluon, W pair, Z, and Higgs. W+ and W- are grouped. Gluon color components and quark colors are JSON not separate rows. This category count is not an absolute count of elementary particles, independen JSON t states, or all physical entities.\n\nNeutrino flavor labels are not mass-eigenstate labels. The a JSON rtifact does not resolve Dirac versus Majorana nature or imply that a minimal massless-neutrino mod JSON el explains measured neutrino masses. Established particle observations also do not establish stabl JSON e bulk-material ingredients. [CERN Standard Model](https://home.web.cern.ch/science/physics/standar JSON d-model/), [PDG 2026 tables](https://pdg.lbl.gov/2026/tables/contents_tables.html).\n\nUse the [PDG JSON 2026 API edition](https://pdg.lbl.gov/2026/api/index.html) and preserve its version if numerical p JSON article data are added. PDG includes searches as well as measured particles: inclusion in a listing JSON is not confirmation of existence.\n\nComposite-particle records must specify their construction le JSON vel and state. Counting an atom, its nucleus and its nucleons as independent mixture constituents w JSON ould double-count the same inventory unless a particular physical construction is defined. Quasipar JSON ticles require a host and conditions; illustrative labels such as phonon or magnon are not addition JSON al chemical elements. [IUPAC quasiparticle](https://goldbook.iupac.org/terms/view/08863).\n\n## Nuc JSON lide identifiers and provenance\n\nUse Z, A and a source-qualified nuclear-state identifier. Keep o JSON riginal source labels and excitation information. The local key template is `Z{Z}-A{A}-{state\_local JSON \_id}@{source\_edition}`. A local label such as m1 must be mapped to the actual evaluated source; lab JSON els must not silently identify different states across editions. Ion charge is a separate electroni JSON c-state qualifier.\n\nMathematical conditions such as integer $A \geq Z$ do not prove existence. Preser JSON ve uncertainty, limits, estimated values, unknown values and unresolved energy offsets. Do not infe JSON r zero from a blank. Existence status is distinct from whether an individual property, such as mass JSON , is measured or estimated.\n\n[NUBASE2020](https://www-nds.iaea.org/amdc/ame2020/NUBASE2020.pdf) r JSON eports, for its 30 October 2020 experimental-data cutoff, 3,340 ground-state nuclides and 1,938 exc JSON ited isomeric states based on experimental information, plus 218 unobserved ground states and 45 un JSON bserved isomers treated by estimates. These historical categories are not a current count of all c JSON onfirmed isotopes. Its stated isomer scope uses half-lives of at least 100 ns.\n\nThe [IAEA LiveCha JSON rt API guide](https://www-nds.iaea.org/relnsd/vcharthtml/api_v0_guide.html) describes an ENSDF Apri JSON l 2022 snapshot with other inputs including AME2020 and NUBASE2020. A 2026 retrieval date must not JSON be substituted for an evaluation cutoff. The guide requires care in distinguishing ground and metas JSON table states through energy information. No full nuclide-table download was performed for this arti JSON fact.\n\n## Validation and limits\n\nThe JSON was checked for exactly 138 element records; 118 reco JSON gnized and 20 hypothetical records; unique atomic numbers and symbols; consecutive Z = 1 through 13 JSON 8; valid source references; and 17 particle categories under the stated convention.\n\nThis is an i JSON dentity and evidence-status register. It does not supply material preparation, demonstrate properti JSON es, enumerate every hypothetical particle, establish inventorship or patentability, or establish co JSON mprehensive defensive coverage. New experimental evidence requires an explicitly versioned update r JSON ather than silently changing the meaning of an existing record.\n"

Complete element-label register (138 rows)

Every source field is shown. Z=119-138 remain hypothetical placeholders.

ROW NUBASE:license-evidence

JSON "# NUBASE2020 attribution and license evidence\n\nF.G. Kondev, M. Wang, W.J. Huang, S. Naimi, and G. Audi, *The NUBASE2020 evaluation of nuclear physics properties*, Chinese Physics C 45, 030001 (2021), [DOI 10.1088/1674-1137/abddae](https://doi.org/10.1088/1674-1137/abddae).\n\nThe [official publisher PDF](https://csnsdoc.ihep.ac.cn/fileZGWLC/journal/article/zgwlc/2021/3/PDF/The-NUBASE2020-1.pdf), page 030001-1, contains this notice:\n\n> Content from this work may be used under the terms of the Creative Commons Attribution 3.0 licence.\n\nThat same notice requires continued attribution to the authors, title, journal citation, and DOI. The [publisher article's reuse policy](https://csnsdoc.ihep.ac.cn/article/doi/10.1088/1674-1137/abddae) also discusses CC BY 3.0 reuse. The [license](https://creativecommons.org/licenses/by/3.0/) permits sharing and adaptation subject to its terms. No publisher endorsement is claimed.\n\nThe official companion ASCII table was obtained from the [IAEA Atomic Mass Data Center dissemination page](https://www-nds.iaea.org/amdc/), which requests citation of the evaluation paper. Its original header supplies that citation; it does not contain a separate license notice. The confirmed license belongs to the published work. This distinction is retained instead of inventing an independent license statement for the downloaded file.\n\nThis local archive preserves the original scientific-data bytes. New raw-field organization, source offsets, conservative parsing, and verification are transformations made for this project. Numerical values were not revised. No license grant for the applicant's unrelated patent draft, new code, or other repository content is added by this attribution file.\n\nOnly the relevant publication notice, cutoff, and schema information were inspected. No complete publisher PDF, figures, reference list, or commentary table is republished in this archive. The short notice above is the only direct quotation; the rest of this file is a paraphrase or an explanation of this archive's handling.\n"

ROW NUBASE:README

JSON "# Dated NUBASE2020 nuclear state archive\n\nThis archive preserves the specific official ASCII table identified by `source\_metadata.json`. It accounts for all 5,843 state rows in that snapshot, including 3,558 distinct `(A,Z)` pairs and the free neutron at `Z=0`. It supplies concrete isotope and nuclear-state identifiers for the disclosure framework without assuming that every listed state is observed, stable, synthesizable, or usable in a material.\n\n## Source and chronology\n\nCredit the [NUBASE2020 evaluation by Kondev and colleagues](https://doi.org/10.1088/1674-1137/abddae), Chinese Physics C 45, 030001 (2021). The original data came from the [official IAEA dissemination site](https://www-nds.iaea.org/amdc/). The publisher's CC BY 3.0 notice and the companion file's attribution distinction are documented in `license\_attribution.md`. \n\nKeep three dates separate: the paper's stated experimental-data availability boundary of October 30, 2020; the server's November 11, 2022 Last-Modified header; and this download's September 30, 2026 UTC response date. One literal discovery-year field is `2021`: source line 2442, byte offset 318061, columns 115-118, for `NUBASE2020:Z047:A127:S2`. Its complete row is retained in `archive\_counts.json`. A discovery year does not itself reveal when information reached the evaluators. No new scientific cutoff is inferred from any of these dates.\n\n## Preserved files\n\n| File | Role | --- | --- | \n| `nubase\_4.mas20.txt` | Original 761,906 ASCII bytes, unchanged. | \n| `schema\_header.txt` | Original 25 header lines, including the source fixed-width schema. | \n| `column\_schema.json` | One-based inclusive columns, documented fields, unassigned gaps, and preservation policies. | \n| `source\_metadata.json` | Edition, URLs, citation, chronology, license evidence, original hash, and limits. | \n| `parse\_nubase.py` | Portable standard-library parser; no network requests and no parsing on import. | \n| `verify\_nuclear\_archive.py` | Independent byte, column, identity, property, sample, and deliberate-defect checks. | \n| `archive\_counts.json` | Counts, source-index distributions, late-year row, and ambiguous-token counts. | \n| `verification\_report.json` | Actual offline verification result. | \n| `portability\_report.json` | Verification with normalized JSON omitted, plus import and report-identity checks. | \n| `portable\_bundle\_manifest.json` | Required portable files and hashes; optional normalized JSON is recorded separately. | \n| `nuclear\_states.json` | Optional generated normalized view; 18,118,327 bytes. | \n\nIt may be omitted from a distribution. \n\nThe source SHA-256 is `1585a5eea86c5e17e90307c7e6e786d060049c4039e392a261ff6db977df9859`. The parser rejects a different input hash until that new snapshot is reviewed deliberately.\n\n## Conservative normalization\n\nEach state keeps the source's `(Z, A, state index)`, suffix, line number, byte offset, complete original row, and every raw fixed-width field. Gaps are retained. Two rows extend beyond documented column 209; their trailing content is kept without assigning it an invented meaning. Short rows retain actual slices rather than fabricated padding.\n\nParsed decimal values remain strings. Numeric values, operators, uncertainties, and units occupy separate fields. Unrecognized text stays raw. The nominal half-life uncertainty columns actually contain 299 auxiliary bounds and two isospin annotations; those are not treated as numer

CONT NUBASE:README

NUBASE2020: exact header and complete raw-column schema

One-based inclusive ASCII byte columns; all gaps, short slices and overflow beyond column 209 are retained. The # marker qualifies a property estimated from systematics, not observation status. Indices 3-6 may also label isomers. Bounds and isospin annotations must not become ordinary error bars; non-existent tokens remain literal source text.

```

Complete NUBASE2020 snapshot (5,843 source-state rows)

Source order retained. Each card identifies Z, A, source state index, suffix, source line, zero-based byte offset and actual row width. Cnnn-nnn labels give original one-based columns; the quoted slices are JSON strings. Decode and join slices without adding spaces to reconstruct a row. The LF terminator is not printed. No numeric property is recalculated or interpreted as proof of an observed/usable state. Z=0 includes the free neutron.

```

PDG 2026.0: selections, schema and attribution

The selected identity archive retains all columns of its declared rows, including null, empty string, zero, question marks and repeated names. Publication cutoff 2026-01-15 is separate from database release/retrieval dates. Source CC BY 4.0 attribution and modifications are recorded below. No property/decay/measurement archive is added.

JSON "# PDG 2026.0 particle identity archive\n\nPrepared and checked 30 September 2026 UTC. This is an edition-qualified identity/name archive for the materials disclosure research package. It does not establish that every listed entity is discovered, preparable or a stable material constituent. No patent enablement assessment is made.\n\nThe archive was extracted offline from the official [pdg-2026.0.sqlite download](https://pdg.lbl.gov/2026/api/pdg-2026.0.sqlite), selected through the [PDG 2026 API download index](https://pdg.lbl.gov/2026/api/index.html). The source database is 25,751,552 bytes, with SHA-256 `40dc2587d9ae912d26fafb6b41f300f341d2a1f4bd620ff5b5f03827c39453fe`. Its stored schema version is `0.3`, edition is `2026`, and release timestamp is `2026-05-30 13:41:24 PDT`. The official publisher gives **15 January 2026** as the [Listings/Summary Tables cutoff](https://pdg.lbl.gov/2026/listings/contents_listings.html). These dates have separate meanings; the retrieval did not advance the source cutoff.\n\nThe successful download was observed at `2026-09-30T02:30:54Z`. Server metadata reported Last-Modified `Mon, 01 Jun 2026 18:25:28 GMT`. Those fields are preserved as download observations, not proof of a patent priority date or an independently trusted timestamp. The database's internal release metadata is retained without rewriting it to match the server header.\n\n## Included records\n\n| SQLite source table | Selection | Exported rows | Meaning |\n| --- | ---: | --- |\n| `pdgparticle` | Every row and source column | 1,170 | Charge-state identity rows, with original primary keys, PDG identifiers, Monte Carlo IDs, names, charge, conjugation type and quantum-number strings |\n| `pdgid` | Every `PART` and `SRCH` row | 450 | 439 particle groups and 11 search groups; includes groups with no charge-state row |\n| `pdgitem` | Every row and source column | 3,270 | Names, aliases, generic names, shortcuts, lists and textual entries, retaining their source types |\n| `pdgitem_map` | Every row and source column | 1,341 | Source name/alias/set mappings, retaining source and target IDs |\n| `pdgdoc` | Every row and source column | 71 | Original code definitions, including types, flags and conjugation codes |\n| `pdginfo` | Every row and source column | 10 | Source metadata and citation, retained in the archive preamble\n\nThe [normalized JSON](pdg2026_identity_archive.json) stores these source columns in deterministic primary-key order. [Metadata](pdg2026_identity_metadata.json) records schemas, selections, source metadata, download evidence, counts, nulls, known ambiguities and scope limits. "Complete" means complete for these selections from the pinned database; it does not mean every theoretical particle, nuclear state, excitation or property is represented.\n\nThere are 438 distinct PDG identity groups referenced by the 1,170 charge-state rows. Twelve of the 450 exported particle/search groups have no such row: all 11 search groups and the source `f_0(2330)` group. They remain in the export. Generic names, decay texts and aliases are separate table entries and are not counted as new physical species.\n\n## Scientific interpretation and original unknowns\n\nNo discovery/existence-status column is provided in these identity tables, and **zero physical-existence assessments** were performed. The database-level `status = production` describes the database release. `PART`, `SRCH`, category flags, Monte Carlo IDs, spin strings and conjugation codes are not discovery certificates. For example, the source includes a graviton identity row of type `PART` and category `G`; inclusion does not establish its discovery.\n\n`cc_type` describes particle, antiparticle or self-conjugate state. The original codebook is included. This classification does not state whether a particle has been observed. PDG identifiers, Monte Carlo IDs and source row IDs are different identifiers and retain their distinct fields.\n\nSQLite `NULL` values remain JSON `null`; literal question marks, blanks, compound strings and source quantum-number values remain unchanged. There are 554 null Monte Carlo IDs and 17 null spin fields. A known source ambiguity is deliberately retained: two rows share the name `P_c_bar(4312)+` and name-item ID 1593 while referencing distinct PDG identifiers `B185` and `B205` and different isospin strings. No correction or deduplication by name was attempted. Join through numeric source primary/foreign keys and edition-qualified identifiers, following the [PDG schema documentation](https://pdgapi.lbl.gov/doc/schema.html).\n\nThis selection omits available measurements, mass splittings/lifetimes, property uncertainties and limits, decays, references, footnotes, listing text and historical Summary Table editions. Those data require a separate extraction and interpretation. The upstream [API development-status page](https://pdgapi.lbl.gov/doc/status.html) also identifies inaccessible fit/correlation information, conservation-law data, some headers/notes, incomplete parentheses in some text values and missing numerical values for some limits. The identity archive does not
```

CONT PDG:README

JSON fill those omissions or convert a limit into a discovery.\n\n## Attribution and reuse\n\nSource: **
 JSON F. Takahashi et al. (Particle Data Group), Int. J. Mod. Phys. A 41, 2630011 (2026)**. The original
 JSON citation is retained in source metadata; see the [official 2026 author/citation page](https://pdg.l
 JSON bl.gov/2026/html/authors_2026.html).\n\nThe source database explicitly records `CC BY 4.0`; PDG's [
 JSON license documentation](https://pdgapi.lbl.gov/doc/schema.html#license) identifies that license for
 JSON editions starting in 2024. Source-derived records here are provided with attribution under [Creativ
 JSON e Commons Attribution 4.0](https://creativecommons.org/licenses/by/4.0/). Changes consist of select
 JSON ing identity/name/mapping/code tables and serializing them into deterministic UTF-8 JSON. Source va
 JSON lues were not scientifically reclassified, corrected or deduplicated. This attribution applies to t
 JSON he PDG-derived data.\n\n## Reproduce and verify\n\nThe [extraction/verification script](extract_pdg
 JSON _identities.py) requires Python 3.12 and its standard library, with no package or global installati
 JSON on. Its download command performs one versioned SQLite download. It uses no bulk REST requests, con
 JSON sistent with [PDG's terms](https://pdgapi.lbl.gov/doc/restapi.html#terms-of-use).\n\nRun the offlin
 JSON e archive checks from this directory:\n\n```\nconsole\npython extract_pdg_identities.py verify\n```\n\n
 JSON \nFor the following reproduction commands, first change to the **repository root**. The sibling `..
 JSON /materials-archive-scratch/` holds the downloaded database, observation and regenerated output outs
 JSON ide the repository; it is not a directory inside this archive. Replace it with another outside-repo
 JSON sitory location if needed:\n\n```\nconsole\npython data/particle_archive/extract_pdg_identities.py do
 JSON wnload --destination ../materials-archive-scratch/pdg-2026.0.sqlite --observation ../materials-arch
 JSON ive-scratch/download_observation.json\npython data/particle_archive/extract_pdg_identities.py extra
 JSON ct --database ../materials-archive-scratch/pdg-2026.0.sqlite --download-observation ../materials-ar
 JSON chive-scratch/download_observation.json --output-directory ../materials-archive-scratch/regenerated
 JSON \npython data/particle_archive/extract_pdg_identities.py verify --database ../materials-archive-scr
 JSON atch/pdg-2026.0.sqlite\n```\n\nThe downloader requires distinct database, partial and observation p
 JSON aths, refuses existing output files, and preserves an unexpected partial download for inspection. P
 JSON ublication uses an exclusive same-filesystem hard link after verifying the bytes; a destination cre
 JSON ated by another writer is preserved. A filesystem without suitable hard-link support causes a safe
 JSON failure, with the verified partial retained for inspection. The extractor refuses a database with a
 JSON different size, hash, edition, schema or license. A changed upstream release needs explicit review
 JSON rather than a silent regeneration. The raw SQLite file remains scratch material and is not part of
 JSON this text archive.\n\n[Recorded verification](verification_report.json) passed complete selected-t
 JSON able comparison against the pinned SQLite file, including every selected source row/column, null an
 JSON d repeated name. The source passed SQLite integrity and foreign-key checks. Exported references, ro
 JSON w counts, source schema, deterministic bytes and source/derived hashes were also checked. Checksums
 JSON demonstrate consistency with the recorded source snapshot; they do not prove scientific existence,
 JSON legal effect or a trusted publication timestamp.\n\nThe [additional verification record](adversari
 JSON al_verification_report.json) records six successful checks: import/offline verification with network
 JSON k requests disabled; rejection of an edited spin, a removed charge-state row, removed search groups
 JSON and an unsupported discovery assertion; and rejection of an edited/rehashed spin through compariso
 JSON n against the raw source. This last check confirms the distinction between internal archive consist
 JSON ency and agreement with the source database.\n"

Complete PDG source metadata rows (10 rows)

The complete source_database_info_rows preamble represents the selected pdginfo table. Production is a database-release status, not a physical-existence assessment.

Complete selected pdgid records (450 rows)

All PART and SRCH source rows; other pdgid types are outside this selection. The 12 groups without charge-state rows remain present. IDs are edition/table/source-key qualified. Compact JSON preserves source types and values; join visible chunks without adding characters. A row, name, MCID, flag, quantum-number string or conjugation code does not certify discovery.

Complete selected pdgitem records (3,270 rows)

All rows and columns of this selected source table are present. IDs are edition/table/source-key qualified. Compact JSON preserves source types and values; join visible chunks without adding characters. A row , name, MCID, flag, quantum-number string or conjugation code does not certify discovery.

Complete selected pdgitem_map records (1,341 rows)

All rows and columns of this selected source table are present. IDs are edition/table/source-key qualified. Compact JSON preserves source types and values; join visible chunks without adding characters. A row , name, MCID, flag, quantum-number string or conjugation code does not certify discovery.

Complete selected pdgdoc records (71 rows)

All rows and columns of this selected source table are present. IDs are edition/table/source-key qualified. Compact JSON preserves source types and values; join visible chunks without adding characters. A row, name, MCID, flag, quantum-number string or conjugation code does not certify discovery.

ROW PDG2026:pdgdoc:1

```
JSON {"id":1,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"AC","indicator":"OUR AVERAGE","description":"from weighted average of selected data","comment":null}
```

ROW PDG2026:pdgdoc:2

```
JSON {"id":2,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"L","indicator":"BEST LIMIT","description":"best limit among available data","comment":null}
```

ROW PDG2026:pdgdoc:3

```
JSON {"id":3,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"D","indicator":"OUR AVERAGE","description":"from branching ratio of another mode","comment":null}
```

ROW PDG2026:pdgdoc:4

```
JSON {"id":4,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"V","indicator":"OUR EVALUATION","description":"not from direct measurement, but evaluated from measurements of related quantities","comment":null}
```

ROW PDG2026:pdgdoc:5

```
JSON {"id":5,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"OL","indicator":"OUR LIMIT","description":"for special cases where limit is evaluated from measured ratios or other data","comment":null}
```

ROW PDG2026:pdgdoc:6

```
JSON {"id":6,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"OM","indicator":"","description":"extra entry, printed below summary value","comment":null}
```

ROW PDG2026:pdgdoc:7

```
JSON {"id":7,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"ON","indicator":"","description":"extra entry, printed above summary value","comment":null}
```

ROW PDG2026:pdgdoc:8

```
JSON {"id":8,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"FC","indicator":"OUR FIT","description":"from constrained or overdetermined multi-parameter fit of selected data","comment":null}
```

ROW PDG2026:pdgdoc:9

```
JSON {"id":9,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"DR","indicator":"OUR FIT","description":"fitted decay rates","comment":null}
```

ROW PDG2026:pdgdoc:10

```
JSON {"id":10,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"E","indicator":"OUR ESTIMATE","description":"from estimate chosen by person rather than statistical procedure","comment":null}
```

ROW PDG2026:pdgdoc:11

```
JSON {"id":11,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"O","indicator":"","description":"our evaluation without a default description","comment":null}
```

ROW PDG2026:pdgdoc:12

```
JSON {"id":12,"table_name":"PDGDATA","column_name":"VALUE_TYPE","value":"DV","indicator":"OUR EVALUATION","description":"reserved for internal use","comment":null}
```

ROW PDG2026:pdgdoc:13

```
JSON {"id":13,"table_name":"PDGDATA","column_name":"LIMIT_TYPE","value":null,"indicator":"","description":"NULL means not a limit (i.e. a measurement)","comment":null}
```

ROW PDG2026:pdgdoc:14

```
JSON {"id":14,"table_name":"PDGDATA","column_name":"LIMIT_TYPE","value":"U","indicator":"","description":"upper Limit","comment":null}
```

ROW PDG2026:pdgdoc:15

```
